

ABSTRACT OF THE DISCLOSURE

The present invention is an applicator barrel with a taped finger grip. The applicator barrel includes a
5 barrel body having an outer surface. A three-dimensional tape is connected to a portion of the outer surface and includes a first surface and a second surface opposite said first surface. The first surface has at least one integrally formed gripping structure extending outwardly
10 from the first surface to provide a gripping surface, and the second surface is adhesive to connect the tape to the barrel.
